

What is gaze-based interaction?

A system that uses eye movement as an input to interact with objects inside a virtual game environment.

Why is dwell time useful?

It is needed to ensure that users have sufficient time to focus on the selected object to view all its functionalities without it executing immediately when gaze is locked

How does sensory feedback improve realism?

It ensures realism by stimulating multiple senses such as vision, hearing and touch to improve the immersion and interactivity between the user and the virtual environment.

Which cube felt more immersive and why?

Cube A

Because it uses both vision and audio changes to the user. Other two cubes are vision only it changes the size and color of the cube. But Cube A plays a sound when it scales making it seem more realistic due to appealing to both eye and ear.
